Pytorch Lear the Basics: Datasets, Dataloaders
Fashion MNIST → Base training data for model
↳ 60,000 training example, 10,000 test examples
Root = where train/test data is stored
Train = Specifies training on the dataset
target_Transform: Specifies the feature model is being trained on
Traing_data[index] → Indexs data to assign values to each thing
Ex) Image Index → Dog

__getitem__
↳ Converts image to Tensor, returns as a Tensor the image but also label

Preparing DataLoaders
↳ Pass data as mall batches, reshuffle to prevent model memorization
