PyTorch Learn The Basics | Tensors

Tensor: way to represent data so mathematical calculation can be performed

Dimensions → Storage of values in Tensor

[Image, pixels, height pixels, width pixels]

PyTorch Tensors: Allows Computation on GPU, and works with [automatic differentiation] → Allows NN to change / reduce the loss

↳ Library

Tensors like objects inherit from master object

Shape relates to dimension if dimension of 1 size 3 → could represent scene in using sitin

Tensor.Device → fast process of GPU

↳ MACS → MPS → GPU Acceleration

Get value from Tensor through tensor[0]

A·B = Element wise multiplication

A@B = Matrix multiplication

↳ Allows efficient calculation for optimization of weights

tensor.operation_(#) add to existing tensor
